What is a microinverter?

The Microinverters are single PV panel low power inverters characterized by high power density and superior efficiency. This white paper explores a single stage microinverter capable of delivering power up to 500 W exploiting Gallium Nitride (GaN) power switches technology.

What is a micro-inverter solar panel?

Rather than a large, central string inverter, a micro-inverter is a small DC-AC converter that is connected to the back of each solar panel. The primary benefits of the micro-inverters is that they can deliver up to 25% more power than conventional inverter systems. They are ideal for areas where shading may be an issue affecting performance.

Do microinverters need a centralized string inverter unit?

No, microinverters do not need a centralized string inverter unit. Instead, each microinverter handles the inverting capabilities for its paired solar panel, making each pairing a mini self-contained solar power system.

How do microinverters work?

Microinverters convert the electricity from your solar panels into usable electricity. Unlike centralized string inverters, which are typically responsible for an entire solar panel system, microinverters are installed at the individual solar panel site.
