-----

Explore the fascinating composition and structure of the solar system, including planets, moons, asteroids, and their roles in our cosmic neighborhood.

The solar system composition can be taken as the overall composition of the molecular cloud within the interstellar medium from which the solar system formed 4.567 billion years ago.

The chemical composition of the solar system is mainly dominated by the composition of the Sun, which has 98.9% of the mass of all bodies in the system.

When the Solar System formed, rocks (and other dense, heavy materials in the dust cloud such as iron and uranium) tended to gather closer to the ...

The Solar System is the assembly formed by the Sun, eight planets (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus & Neptune), their moons and other minor planets.

The Solar System consists of the Sun, planets, moons, asteroids, and comets. Learn about its main components and how they interact in space.

The Solar System is within the heliosphere constantly flooded by the charged plasma particles of the solar wind, which forms with the interplanetary dust, gas and cosmic rays between the ...

While the composition of gas and dust in a molecular cloud is fairly uniform, everything changes once a star begins to form. The Sun and planets of our solar system all ...

The Solar System consists of the Sun, planets, moons, asteroids, and comets. Learn about its main components and how they ...

The solar system consists of the Sun and those bodies orbiting around it: 8 (formerly 9) planets with about 170 known planetary satellites (moons).

OverviewGeneral characteristicsDefinitionFormation and evolutionSunInner Solar SystemOuter Solar SystemTrans-Neptunian regionAstronomers sometimes divide the Solar System structure into separate regions. The inner Solar System includes Mercury, Venus, Earth, Mars, and the bodies in the asteroid belt. The outer Solar System includes Jupiter, Saturn, Uranus, Neptune, and the bodies in the Kuiper belt. Since the discovery of the Kuiper belt, the outermost parts of the Solar System are considered a distinct ...

Revolving around the sun are eight planets. The planets are divided into two categories based on their composition, terrestrial and ...

When the Solar System formed, rocks (and other dense, heavy materials in the dust cloud such as iron and uranium) tended to gather closer to the Sun, and these materials combined ...

Revolving around the sun are eight planets. The planets are divided into two categories based on their composition, terrestrial and Jovian. Terrestrial planets, including ...
