-----

Solar Factor or Total Solar Energy Transmittance or g-value (g%) is the total solar radiation transmitted by the glass. Shading Coefficient (sc) is Solar ...

In response to the increased occurrence of overheating problems in glazed buildings in recent years, EMPA has focussed on the determination and modelling of the total ...

This software supports the calculation of visible light transmittance, UV transmittance, solar transmittance, and solar reflectance for flat glass according to JIS R3106.

Total solar energy transmittance of the sun shading system and glazing combined. This value is normally calculated using the simplified DIN EN ...

% Solar Transmittance (T-sol): The ratio of the amount of total solar energy in the full solar wavelength range (300-2,500 nanometers) that is allowed to pass directly through a glazing ...

Solar Factor or Total Solar Energy Transmittance or g-value (g%) is the total solar radiation transmitted by the glass. Shading Coefficient (sc) is Solar Factor divided by 0.87.

Total solar energy transmittance of the sun shading system and glazing combined. This value is normally calculated using the simplified DIN EN 13363-1/ DIN EN ISO 52022-1 method or the ...

This paper simulation, presents the findings of a comparative study for evaluating the effects of different solar shading devices on the solar transmittance properties of windows with different ...

This paper aims to assist with the choice of these methods by applying each to a simplified energy model

containing a complex shading device and comparing the total solar energy ...

EN 13363-1 - the Simplified method - calculates approximate values for the total solar energy transmittance (gtot) of glazing and shading combined. Inputs for this calculation are solar ...

EN 13363-1 - the Simplified method - calculates approximate values for the total solar energy transmittance (gtot) of glazing and shading combined. ...

This guidance note investigates g-value and gtot as these provide key energy performance figures for assessing the amount of solar energy transmitted into a building.

SHGC is the successor to the shading coefficient used in the United States and it is the ratio of transmitted solar radiation to incident solar radiation of an entire window assembly.
